In this chapter, we show how to connect the panel computer to the network and to various devices.

The following topics are covered in this chapter:

❑ **Panel Mounting**
❑ **VESA Mounting**
❑ **Wiring Requirements**
❑ **Temperature Requirements**
❑ **Grounding the MPC-2070 Series**
❑ **Powering On/Off the MPC-2070 Series**
❑ **Display-Control Buttons**
❑ **Connector Description**
  ➢ DC Power Input
  ➢ Serial Ports
  ➢ Ethernet Ports
  ➢ USB Ports
  ➢ DIO Port
❑ **Installing a CFast or SD Card**

Panel Mounting

The MPC-2070 Series comes with 6 clamp mounts that allow for installation onto a wall (where space has been cut out to accommodate the rest of the hardware) or into computing stations where a flush mount is desired. The maximum thickness of the surface to which the computer will be clamped is 4.6 mm. For a secure mounting, all 6 clamps must be used. The clamp arms are fastened into slots on all four sides of the MPC-2070. Use the short M4 SUS (stainless) screws to fasten the clamp arms to the MPC-2070 mounting slots, as shown in the diagram below. Next, use the clamps to fasten the computer to its mounting point. Note the torque value that is shown in the figure below as guidance when fastening the screws on the clamps.
A	B	C	D	R	Mount Kits (pcs)
4.5mm	46mm	192.3mm	132.5mm	2mm	6pcs

VESA Mounting

The MPC-2070 is provided with VESA mounting holes on the back panel, which you can use directly without the need for an adapter. The dimension of the VESA mounting area is 50 x 75 mm. You will require four M4 x 6mm screws to mount the MPC-2070.
Wiring Requirements

This section describes how to connect peripheral devices to the panel computer.

You should read and follow these common safety precautions before proceeding with the installation of any electronic device:

- Use separate paths to route wiring for power and devices. If power wiring and device wiring paths must cross, make sure the wires are perpendicular at the intersection point.

NOTE	Do not run signal or communication wiring together with power wiring in the same wire conduit. To avoid interference, wires with different signal characteristics should be routed separately.

- Use the type of signal transmitted through a wire to determine which wires should be kept separate. The rule of thumb is that wiring that shares similar electrical characteristics can be bundled together.
- Keep input wiring and output wiring separate.
- It is advisable to label the wiring to all devices in the system.

> ⚠ **ATTENTION**
>
> **Safety First!**
> Be sure to disconnect the power cord before installing and/or wiring your MPC-2070 Series.
> **Wiring Caution!**
> Calculate the maximum possible current in each power wire and common wire. Observe all electrical codes dictating the maximum current allowable for each wire size.
> If the current goes above the maximum ratings, the wiring could overheat, causing serious damage to your equipment.

Temperature Requirements

Be careful when handling the unit. When the unit is plugged in, the internal components generate heat, and consequently the outer casing may feel hot to the touch.

We recommend taking the following precautions to minimize heat build-up within the display:
- Position the display within ±40° of the vertical.
- Install an external fan to increase airflow upwards through the display if (a) the display is not positioned within ±40° of the vertical, (b) the ambient temperature exceeds 25°C, or (c) the display is used in a location with minimal ventilation.

Grounding the MPC-2070 Series

Before you power on the MPC-2070 Series, please ground the MPC-2070 as grounding and wire routing help limit the effects of noise due to electromagnetic interference (EMI). Run the ground connection from the ground screw to the grounding surface prior to connecting the power.

> ⚠️ **ATTENTION**
>
> This product is intended to be mounted to a well-grounded mounting surface, such as a metal panel.

Grounding: See the figure shown below for the location of the grounding connector. Connect the grounding wire to an appropriate grounded metal surface.

Grounding Connector
Powering On/Off the MPC-2070 Series

Connect a **Terminal Block to Power Jack Converter** to the MPC-2070 terminal block and connect at least a 30 W power adapter to the converter. Supply power through the power adapter. After you have connected a power source, press the **Power** button to turn the computer on. It takes about 10 to 30 seconds for the system to boot up.

DC 9-36V ⎓
To power off the MPC-2070, we recommend using the "shut down" function provided by the OS installed on the MPC. If you use the **Power** button, you may enter one of the following states depending on the power management settings in the OS: standby, hibernation, or system shutdown mode. If you encounter problems, you can press and hold the **Power** button for 4 seconds to force a hard shutdown of the system.

Display-Control Buttons

The MPC-2070 is provided with two display-control buttons on the right panel.

Control Buttons
The usage of the display-control buttons is described in the following table:

		Press and hold for 4 seconds	Power off
+ ☀ –	Brightness +	Press	Manually increase the brightness of the panel
	Brightness -	Press	Manually decrease the brightness of the panel

⚠️ **ATTENTION**

The MPC-2070 Series comes with a 1000-nit display, the brightness level of which is adjustable up to level 10. The display is optimized for use in the -40 to 70°C temperature range. However, if you are operating the MPC-2070 at an ambient temperature of 60°C or higher, we recommend setting the brightness level of the display to 8 or less to extend the lifetime of the display.

Connector Description

DC Power Input

The MPC-2070 uses a DC power input. To connect the power source to the 2-pin terminal block, use a 60 W power adapter. The terminal block is available in the accessories package. The DC pin assignments are show in the figure.
Serial Ports

The MPC-2070 offers two software-selectable RS-232/422/485 serial ports over a DB9 connector. The pin assignments for the ports are shown in the table below:
Pin	RS-232	RS-422	RS-485 (4-wire)	RS-485 (2-wire)
1	DCD	TxDA(-)	TxDA(-)	–
2	RxD	TxDB(+)	TxDB(+)	–
3	TxD	RxDB(+)	RxDB(+)	DataB(+)
4	DTR	RxDA(-)	RxDA(-)	DataA(-)
5	GND	GND	GND	GND

Ethernet Ports

The pin assignments for the two Fast Ethernet 100/1000 Mbps RJ45 ports are shown in the following table:

The 10/100/1000 Mbps Ethernet LAN port uses 8-pin RJ45 connectors. The following diagram shows the pinouts and the descriptions for these ports.

LAN (on connectors)	Green	100 Mbps Ethernet mode
	Yellow	1000 Mbps (Gigabit) Ethernet mode
	Off	No activity or 10 Mbps Ethernet mode

4	–	TRD(2)+
5	–	TRD(2)-
6	ERx-	TRD(1)-
7	–	TRD(3)+
8	–	TRD(3)-

The indicators on the LAN ports indicate the following:

LAN 1/LAN 2 (indicators on the connectors)	Green	100 Mbps Ethernet mode
	Yellow	1000 Mbps (Gigabit) Ethernet mode
	Off	No activity / 10 Mbps Ethernet mode

USB Ports

Four USB 2.0 ports are available on the bottom panel. Use these ports to connect mass storage drives and other peripherals.

DIO Port

The MPC-2070 is provided with a DIO port, which is a 10-pin terminal block that includes 4 DIs and 4 DOs as illustrated in the diagram.
Installing a CFast or SD Card

MPC-2070 provides two storage options—CFast and SD card. The storage slots are located on the left panel. You can install the OS on the CFast card and save your data into the SD card. For a list of compatible CFast models, check the component compatibility report for MPC-2070 available on the Moxa website.

To install the storage devices, do the following:

1. Remove the 2 screws holding the storage-slot cover to the MPC-2070.
2. Insert the CFast or SD card into the slot using the push-push mechanism.
3. Reattach the cover and secure it with screws.

4

BIOS Settings

In this chapter, we describe the BIOS settings for the MPC-2070 embedded computer. The BIOS is a set of input/output control routines for peripherals. The BIOS is used to initialize basic peripherals and helps boot the operating system before the operating system is loaded. The BIOS setup allows the user to modify the system configurations of these basic input/output peripherals. All of the configurations are stored in the CMOS RAM, which has a backup battery power in case the computer is not connected to a power source. Consequently, the data stored in the CMOS RAM is retained when the system is rebooted or the power is disconnected..

Upgrading the BIOS

This section describes how to upgrade the BIOS.

> ⚠️ **WARNING**
>
> An improper BIOS upgrade process may permanently damage the computer. We strongly recommend that you contact Moxa technical support for assistance to obtain all the necessary tools and the most up-to-date advice before attempting to upgrade the BIOS on any Moxa device.

Step 1: Create a Bootable USB Disk

Before upgrading the BIOS, every user should first create a bootable USB drive as a system rescue device.

A useful software suite for creating USB RAM drives can be found by searching for Rufus, which can then be downloaded and used to create a bootable RAM drive.

Complete the following steps to create a bootable USB disk using Rufus:

1. Start Rufus* and then in the "Device" drop-down list select the USB device that you want to use as a bootable disk.
   *Rufus official website:
   https://rufus.akeo.ie/?locale=en_US

2. Select **MBR partition scheme for BIOS or UEFI computers** from the "Partition scheme and target system type" drop-down list so it can boot from a legacy BIOS or UEFI.

3. Select **FAT32 (Default)** from the "File system" drop-down list.

4. Select **4096 bytes (Default)** from the "Cluster size" drop-down list.

5. Enter a drive name in the "New volume label" input box.

6. Select the options: **Quick format, Create a bootable disk using FreeDOS**, and **Create extended label and icon files**.

7. Click **Start** to format and create the bootable USB drive.
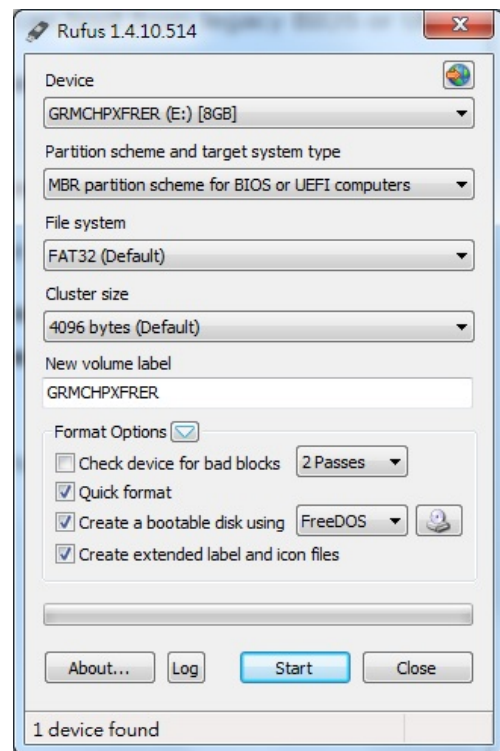

⚠️ **ATTENTION**

When you use a USB drive larger than 4 GB, you will need to convert the file system type to FAT32.

Step 2: Prepare the Upgrade File

You must use the BIOS upgrade installation file to upgrade the BIOS. Contact Moxa technical support for assistance.

1. Get the BIOS upgrade installation file.
   The file name should be in the format: **MPC-20701xxx.exe** (where "xxx" refers to the version numbers).

2. Copy the file to the bootable USB drive.

Step 3: Run the Upgrade Program on the MPC-2070 Computer

1. Reboot the computer, and press F2 during the booting process to display the Boot Manager.
2. Select USB Disk as the first boot source and press [Enter] to continue.

3. When the computer finishes booting up, a command window appears. Go to the directory where the upgrade file is located. For example, if the upgrade file is stored in the MPC-2070 folder, type `cd MPC-2070`.

```
C:\cd MPC-2070
```

4. Run the upgrade program by typing `20701010.exe`

Note that the filename for the upgrade program may vary depending on the version.

```
C:\ MPC-2070>20701010.exe
```

5. The upgrade program will run automatically. Wait until the procedure is complete.

ATTENTION

Do NOT remove the power supply during a BIOS upgrade.

```
C :\ MPC-2070> 20701010.exe
Option: -bios -all -nv -desc -me

              Please do not remove the AC power!
